

# Pivot columns (Power Query)

Excel for Microsoft 365, Excel 2021, Excel 2019, Excel 2016, Excel 2013

You can pivot a column in a table by aggregating matching values in a column to create a new table orientation. The table is first sorted in ascending order by the values in the first column.

When you pivot, you take two original columns and create a new attribute-value pair that represents an intersection point of the new columns:

- **Attributes** Identical values from one original attributes column (in green on the left) are pivoted into several new columns (in green on the right).
- **Values** from the original unpivoted column (in blue on the left) are distributed as values to the corresponding new columns (in blue on the right).
